# Lecture 21

# Closure properties of CFL

- **Closure properties** consider operations on CFL that are guaranteed to produce a CFL
- The CFL's are \_\_\_\_\_ under *union, concatenation, Kleene star, reversal*. 
- CFL's are \_\_\_\_\_ under *intersection, complementation, and set-difference*. 
- But the intersection of a CFL and a regular language is always a \_\_\_\_\_. 

# Set Union

CFL's are closed under union operation.

Proof by Construction:

Input

- CFG  $G_1 = (V_1, \Sigma, R_1, S_1)$
- CFG  $G_2 = (V_2, \Sigma, R_2, S_2)$

Output

- CFG  $G_3 = (V_3, \Sigma, R_3, S_3)$ 
  - $V_3 = V_1 \cup V_2 \cup \{S\}$ 
    - Variable renaming to insure no names shared between  $V_1$  and  $V_2$
    - $S$  is a new symbol not in  $V_1$  or  $V_2$  or  $\Sigma$
  - $S_3 = S$
  - $R_3 = ?$  

# Set Concatenation

CFL's are closed under concatenation operation.

Proof by Construction:

Input

- CFG  $G_1 = (V_1, \Sigma, R_1, S_1)$
- CFG  $G_2 = (V_2, \Sigma, R_2, S_2)$

Output

- CFG  $G_3 = (V_3, \Sigma, R_3, S_3)$ 
  - $V_3 = V_1 \cup V_2 \cup \{S\}$ 
    - Variable renaming to insure no names shared between  $V_1$  and  $V_2$
    - $S$  is a new symbol not in  $V_1$  or  $V_2$  or  $\Sigma$
  - $S_3 = S$
  - $R_3 = ?$

# Kleene Star

CFL's are closed under Kleene star operation.

- Let  $L$  be an arbitrary CFL
- Let  $G_1$  be a CFG s.t.  $L(G_1) = L$ 
  - $G_1$  exists by definition of  $L_1$  in CFL
- Construct CFG  $G_2$  from CFG  $G_1$
- Argue  $L(G_2) = L^*$
- There exists CFG  $G_2$  s.t.  $L(G_2) = L^*$
- $L^*$  is a CFL

# Kleene Star

CFL's are closed under Kleene star operation.

## Proof by Construction:

Input

- CFG  $G_1 = (V_1, \Sigma, R_1, S_1)$

Output

- CFG  $G_2 = (V_2, \Sigma, R_2, S_2)$ 
  - $V_2 = V_1 \text{ union } \{S\}$ 
    - $S$  is a new symbol not in  $V_1$  or  $\Sigma$
  - $S_2 = S$
  - $P_2 = P_1 \cup \text{_____}$

## Kleene Star $(V, \Sigma, R, S)$

Suppose CFG  $G_1 = (\underline{\{S\}}, \{a, b\}, \{S \rightarrow aa \mid ab \mid ba \mid bb\}, S)$

CFG  $G_2$  such that  $L(G_2) = L(G_1^*)$  is:

$(\{S, T\}, \{a, b\}, \{S \rightarrow aa \mid ab \mid ba \mid bb, T \rightarrow ST \mid \epsilon\}, T)$

# Transpose Operation

innovate

achieve

lead

L21

## Reverse Transpose Operation

- ✓ For  $x \in \Sigma^*$  and  $a \in \Sigma$ ,  $(xa)^T = a(x)^T$
- ✓ For example,  $(aaabab)^T = babaaa$
- CFL's are closed under transpose operation.

Let  $G = (V, \Sigma, R, S)$  be a CFG. Then the grammar for  $G^T$  is  $(V, \Sigma, R^T, S)$ , where the production rules of  $R^T$  are constructed by reversing the symbols on LHS and RHS of every production in  $R$ .

Example:  $S \rightarrow aTb \mid b \mid ab$   
 $T \rightarrow Ta \mid b$   $\Rightarrow$   $S \rightarrow bTa \mid b \mid ba$   
 $T \rightarrow aT \mid b$

# Intersection of a CFL and RL

Is intersection of a CFL and RL a RL ?

**Suppose:**

- L is a CFL and corresponding PDA  $M1 = (Q1, \Sigma, \tau1, \Delta1, s1, F1)$
- R is a RL, and corresponding DFA  $M = (Q2, \Sigma, \delta, s2, F2)$

**Construction of PDA M =**

$(Q, \Sigma, \tau, \Delta, s, F), \text{ s.t. } L(M) = L(M1) \cap L(M2)$

$Q = Q1 \times Q2$

$\tau = \tau1$

$s = (s1, s2)$

$F = F1 \times F2$

# Intersection of a CFL and RL

Suppose:

L21

## Intersection of a CFL and RL

Suppose:

- L is a CFL and corresponding PDA  $M1 = (Q1, \Sigma, \tau1, \Delta1, s1, F1)$
- R is a RL, and corresponding DFA  $M = (Q2, \Sigma, \delta, s2, F2)$

Construction of PDA M =

$$(Q, \Sigma, \tau, \Delta, s, F), \text{ s.t. } L(M) = L(M1) \cap L(M2)$$

$$Q = Q1 \times Q2$$

$$\tau = \tau1$$

$$s = (s1, s2)$$

$$F = F1 \times F2$$

Where  $\Delta$  is defined as:

- For each transition of PDA  $(q1, a, \beta) (p1, \gamma)$  and for each state  $q2 \in Q2$ , add the following transition to  $\Delta$ :  $((q1, q2), a, \beta) ((p1, \delta(q2, a)), \gamma)$

- For each transition of PDA  $(q1, \epsilon, \beta) (p1, \gamma)$  and for each state  $q2 \in Q2$ , add the following transition to  $\Delta$ :  $((q1, q2), \epsilon, \beta) ((p1, q2), \gamma)$

# Intersection Operation

Are CFL's closed under intersection operation?

Let  $L1 = \{a^n b^n c^m \mid m, n \geq 0\}$

$L2 = \{a^n b^m c^m \mid m, n \geq 0\}$

$L1 \cap L2 = ??$

# Complement Operation

Are CFL's closed under complement operation?
